Second Order Linear Differential Equations

In this chapter we will start looking at second order differential equations. We will concentrate mostly on constant coefficient second order differential equations. We will derive the solutions for homogeneous differential equations and we will use the methods of undetermined coefficients and variation of parameters to solve non homogeneous differential equations.

In this section give an in depth discussion on the process used to solve homogeneous, linear, second order differential equations, $ay'' + by' + cy = 0$. We derive the characteristic polynomial and discuss how the Principle of Superposition is used to get the general solution.

Differential Equations - Basic Concepts

A differential equation is a mathematical equation that relates some function with its derivatives. In applications, the functions usually represent physical quantities, the derivatives represent their rates of change, and the differential equation defines a relationship between the two.

Since the x in the second equation has a coefficient of 1, that would mean we would not have to divide by a number to solve for it and run the risk of having to work with fractions (YUCK). The easiest route here is to solve the second equation for x, and we definitely want to take the easy route.

The rate law or rate equation for a chemical reaction is an equation that links the reaction rate with the concentrations or pressures of the reactants and constant parameters (normally rate coefficients and partial reaction orders). For many reactions the rate is given by a power law such as $r = k[A]^m[B]^n$ where [A] and [B] express the concentration of the species A and B (usually in moles per liter ...

Introduction. Second Order Reactions are characterized by the property that their rate is proportional to the product of two reactant concentrations (or the square of one concentration).

The pseudo-first order rate equation of Lagergren has long been widely applied. In 1947, Boyd et al.

developed a rate equation which considered rates of ion-exchange adsorption in the exchange adsorption of ions from aqueous solutions by organic zeolites. In the cases of diffusion through a boundary liquid film and adsorption kinetics as a chemical phenomenon, the authors concluded that a mass ...

Did You Know? A solution is a homogeneous mixture of two substances—that is, it has the same distribution of particles throughout. Technically speaking, a solution consists of a mixture of one or more solutes dissolved in a solvent. The particles of solute and solvent are molecules or ions, with one or more solvent molecules bound to each solute particle.

Charge It! Electrons are the negatively charged particles of atom. Together, all of the electrons of an atom create a negative charge that balances the positive charge of the protons in the atomic nucleus. Electrons are extremely small compared to all of the other parts of the atom. The mass of an electron is almost 1,000 times smaller than the mass of a proton.

derived below for the associated case. Since the Legendre differential equation is a second-order ordinary differential equation, it has two linearly independent solutions. A solution which is regular at finite points is called a Legendre function of the first kind, while a solution which is singular at is called a Legendre function of the second kind.
