Tangent Ratio Problems. Consider whether you need to create right triangles by drawing extra lines. For example, divide an isosceles triangle into two congruent right triangles. Decide whether you will need Pythagorean theorem, sine, cosine or tangent. Check that your answer is reasonable. The hypotenuse is the longest side in a right triangle.

Sine, cosine and tangent of an angle represent the ratios that are always true for given angles. Remember these ratios only apply to right triangles. The 3 triangles pictured below illustrate this. Although the side lengths of the right triangles are different, each one has a  $37^\circ$  angle, and as you can see, the sine of 37 is always the same!

**Sine, Cosine and Tangent ratios of a triangle. How to ...**

and since sine and cosine are always -1 to +1 you can't have ratios greater than 1 so the hyp can never be in the numerator of sine and cosine. this leaves  $\cos = \text{adj}/\text{hyp}$  c and a are closest in alphabet and s and o are closest too if you remember you "construct" the tangent from sine and cosine, starting with sine
