If a 100-kg student jumped in a pool from the same height as a 50-kg student, what would likely be true of their resulting waves? The larger student would create a wave with larger amplitude. The smaller student would create a wave with larger amplitude. The larger student would create a wave with larger wavelength.

You have a light wave of vacuum wavelength 633nm traveling through medium of refractive index 1.57. What are the frequency, angular frequency, propagation constant, and phase velocity? What are these values if the light wave was travelling through a vacuum instead? I mainly ask this because I'm told by others that no matter what medium light is traveling through, frequency will stay the same.
