Reflection seismology (or seismic reflection) is a method of exploration geophysics that uses the principles of seismology to estimate the properties of the Earth's subsurface from reflected seismic waves. The method requires a controlled seismic source of energy, such as dynamite or Tovex blast, a specialized air gun or a seismic vibrator, commonly known by the trademark name Vibroseis.

Seismic format . The standard format for 2D and 3D seismic data is SEG Y, a binary format that can easily be imported into Petrel. The SEG Y data are not copied into the Petrel project, rather a link to the seismic data is created. Any type of SEG Y cube can be imported (e.g. full-fold data, near- and far offset cubes, etc). Certain operations are more efficient when seismic data are resident in ...
