Differential geometry is the study of Riemannian manifolds. Differential geometry deals with metrical notions on manifolds, while differential topology deals with nonmetrical notions of manifolds.

Differential Geometry -- from Wolfram MathWorld

Riemannian geometry is the branch of differential geometry that studies Riemannian manifolds, smooth manifolds with a Riemannian metric, i.e. with an inner product on the tangent space at each point that varies smoothly from point to point. This gives, in particular, local notions of angle, length of curves, surface area and volume. From those, some other global quantities can be derived by ...

In differential geometry, a geodesic (γ , $d\gamma$ is $\alpha' d\epsilon s$ Γ k , $d\gamma$ is $\alpha\alpha'$, $-d\gamma$ is $-\alpha\Gamma$ k /) is a curve representing in some sense the shortest path between two points in a surface, or more generally in a Riemannian manifold. It is a generalization of the notion of a "straight line" to a more general setting. The term "geodesic" comes from geodesy, the science of measuring the ...

Introduction Over the past few years, ever since writing "If Susan Can Learn Physics, So Can You", I've been contacted by people from all backgrounds who are inspired and want to learn physics, but don't know where to start, what to learn, what to read, and how to structure their studies. I've spoken with single mothers who want to go back to school and study physics, tenured philosophy ...

In this paper, we address the problem of generating person images conditioned on both pose and appearance information. Specifically, given an image x_a of a person and a target pose $P(x_b)$, extracted from a different image x_b , we synthesize a new image of that person in pose $P(x_b)$, while preserving the visual details in x_a .

En mathématiques, et plus particulièrement en géométrie, la notion de variété peut être appréhendée intuitivement comme la généralisation de la classification qui établit qu'une courbe est une variété de dimension 1 et une surface est une variété de dimension 2. Une variété de dimension n , où n désigne un entier naturel, est un espace topologique localement euclidien, c'est ...
