The answer you come up with is a valid "zero" or "root" or "solution" for " $ax^2 + bx + c = 0$ ", because, if you plug it back into the quadratic, you'll get zero after you simplify. But you cannot graph a complex number on the x, y -plane.

Complex Numbers & The Quadratic Formula

For instance, the equation $x^2 + 1 = 0$ has no real solutions. If you write it as $x^2 = -1$ and try to take the square root of each side, you run into trouble. Not until you have the imaginary numbers can you write that the solution of this equation is $x = \pm i$. The equation has two complex solutions.
