In college algebra, these equations have two variables, x and y . Both carry an unknown value, which means in both equations, x stands for one number, and y stands for another. These two equations intersect at one point, where x and y have the same values for both. Finding these (x,y) values is the definition of the common solution.

The two lines might not cross at all, as in $y = x$ $y = x + 10$. This means there are no solutions, and the system is called inconsistent. If you try to solve this system algebraically, you'll end up with something that's not true, such as $0 = 10$. Whenever you end up with something that's not true, the system is inconsistent.

A solution is a homogeneous mixture of two substances—that is, it has the same distribution of particles throughout. Technically speaking, a solution consists of a mixture of one or more solutes dissolved in a solvent. The particles of solute and solvent are molecules or ions, with one or more solvent molecules bound to each solute particle.
