This sections illustrates the process of solving trigonometric equations of various forms. It also shows you how to check your answer three different ways: algebraically, graphically, and using the concept of equivalence. The following table is a partial lists of typical equations.

### **SOLVING TRIGONOMETRIC EQUATIONS**

Earlier in Lesson 6, four kinematic equations were introduced and discussed. A useful problem-solving strategy was presented for use with these equations and two examples were given that illustrated the use of the strategy. Then, the application of the kinematic equations and the problem-solving strategy to free-fall motion was discussed and illustrated.

A linear system of equations is a set of  $n$  linear equations in  $k$  variables (sometimes called "unknowns"). Linear systems can be represented in matrix form as the matrix equation  $Ax=b$ , (1) where  $A$  is the matrix of coefficients,  $x$  is the column vector of variables, and  $b$  is the column vector of solutions. If  $k < n$ , then the system is (in general) overdetermined and there is no solution.

In this section we will discuss how to solve trig equations. The answers to the equations in this section will all be one of the "standard" angles that most students have memorized after a trig class. However, the process used here can be used for any answer regardless of it being one of the standard angles or not.
