1. Introduction1.1. Early development of Fe-based MGs. Traditional Fe-based MGs are usually formed as ribbons, powders or wires, and they can be prepared by chilling metallic liquids at a critical cooling rate above 10⁶ K/s. The introduction of the first Fe-based MG dates back to 1967 when amorphous Fe-P-C alloys were invented by Duwez and his co-workers .

A phase change material (PCM) is a substance with a high heat of fusion which, melting and solidifying at a certain temperature, is capable of storing and releasing large amounts of energy. Heat is absorbed or released when the material changes from solid to liquid and vice versa; thus, PCMs are classified as latent heat storage (LHS) units.

Creationists often argue that evolutionary processes cannot create new information, or that evolution has no practical benefits. This article disproves those claims by describing the explosive growth and widespread applications of genetic algorithms, a computing technique based on principles of biological evolution.

Stability of Properties Alloy 617 exhibits unusually good metallurgical stability for an alloy of its strength level. Studies involving exposure of material to temperatures of 1100°F to 1400°F showed that although the alloy experiences increases in strength and decreased in ductility it forms no embrittling phases.

ABSTRACT. Nanocomposites, a high performance material exhibit unusual property combinations and unique design possibilities. With an estimated annual growth rate of about 25% and fastest demand to be in engineering plastics and elastomers, their potential is so striking that they are useful in several areas ranging from packaging to biomedical applications.
