Equilibrium Separation Column In equilibrium separation processes, two or more coexisting zones are created with preferential distribution of the different components involved in the process in each zone. For example, in distillation a liquid and vapor zones are created and the components are separated in different proportions between these zones.

Equilibrium Stage Operations. Equilibrium stage operations are based on principles of phase equilibrium. Two phases are mixed together. Some of the components will partition between the

phases as the system tries to reach equilibrium. When the phases are separated, one is enriched with the solute and the other depleted.

They are not operated as equilibrium-staged processes. The key to understanding these membrane processes is the rate of mass transfer, not equilibrium. Yet, despite this difference, we will see many similarities in the solution methods for different flow patterns with the solution methods developed for equilibrium-staged separations.

Separation and purification - Single-stage versus multistage processes: As shown earlier, ease of separation in equilibrium methods is based on the value of the separation factor,  $\alpha$ . When this value is large, separation is easy, requiring little input of work. Thus, if  $\alpha$  lies between 100 and 1,000, a single equilibration in liquid-liquid extraction is sufficient to separate at the level of ...

the equilibrium stage method for equipment built with a series of discrete stages, we will see that the staged design method can also be used for packed columns where there are no discrete stages. This method is a major simplification in the design and analysis of chemical engineering separations that is used in Chapters 2 to 14.
