What is generated as a byproduct of glucose metabolism ...

The Student's t-test is a statistical test that compares the mean and standard deviation of two samples to see if there is a significant difference between them. In an experiment, a t-test might be used to calculate whether or not differences seen between the control and each experimental group are a factor of the manipulated variable or simply the result of chance.

Introduction: Normal bone metabolism is the complex sequence of bone turnover (osteoclastogenesis) and bone formation (osteoblastogenesis) Physiology of bone metabolism

Normal Bone Metabolism - Basic Science - Orthobullets

Introduction. Transamination interconverts pairs of α -amino acids and α -keto acids. During transamination, the alpha amino group of an amino acid (amino acid R1) is transferred to a α keto acid (keto acid R2), this produces a new keto acid while from the original keto acid, a new amino acid is formed (Figure-1)

The degradative pathways can be divided into two major classes. As shown here, most amino acids are converted to intermediates of the citric acid cycle or to pyruvate, which in turn can serve as precursors for gluconeogenesis; these are the glucogenic amino acids. Those amino acids that yield acetoacetate are called ketogenic, since acetoacetate is one of the ketone bodies (see slide 10.4).
