A special right triangle is a right triangle with some regular feature that makes calculations on the triangle easier, or for which simple formulas exist. For example, a right triangle may have angles that form simple relationships, such as  $45^\circ$ - $45^\circ$ - $90^\circ$ . This is called an "angle-based" right triangle.

A right triangle is triangle with an angle of 90 degrees ( $\pi/2$  radians). The sides a, b, and c of such a triangle satisfy the Pythagorean theorem  $a^2+b^2=c^2$ , (1) where the largest side is conventionally denoted c and is called the hypotenuse. The other two sides of lengths a and b are called legs, or sometimes catheti. The favorite A-level math exam question of the protagonist Christopher in ...

The reason these triangles are considered special is because of the ratios of their sides - they are always the same! Special right triangles hold many applications in both geometry and trigonometry.. In this lesson you will learn the general formula for the ratios, and how to find missing sides of any 30 60 90 right triangle.

### Solve a 30-60-90 Triangle with GradeA - Grade A Math Help

There are a couple of special types of right triangles, like the 45°-45° right triangles and the 30°-60° right triangle. Because of their angles it is easier to find the hypotenuse or the legs in these right triangles than in all other right triangles.

A right triangle with the two legs (and their corresponding angles) equal. An isosceles right triangle therefore has angles of 45 degrees, 45 degrees, and 90 degrees. For an isosceles right triangle with side lengths a, the hypotenuse has length  $\sqrt{2}a$ , and the area is  $A=a^2/2$ . The hypotenuse length for  $a=1$  is called Pythagoras's constant.
