Test-driven development (TDD) is a software development process that relies on the repetition of a very short development cycle: requirements are turned into very specific test cases, then the software is improved to pass the new tests, only. This is opposed to software development that allows software to be added that is not proven to meet requirements.

What is Test Driven Development (TDD)? TDD can be defined as a programming practice that instructs developers to write new code only if an automated test has failed. This avoids duplication of code. TDD means "Test Driven Development". The primary goal of TDD is to make the code clearer, simple ...

History. Behavior-driven development is an extension of test-driven development: development that makes use of a simple, domain-specific scripting language. These DSLs convert structured natural language statements into executable tests. The result is a closer relationship to acceptance criteria for a given function and the tests used to validate that functionality.

It's important to note that an agile independent test team works significantly differently than a traditional independent test team. The agile independent test team focuses on a small minority of the testing effort, the hardest part of it, while the development team does the majority of the testing grunt work.
