SPE 167253 3 For the case of unconventional reservoirs (e.g., tight gas, shale gas, liquid-rich shales, and coalbed methane), the starting point for any discussion of decline curve analysis must be an understanding that no simplified time-rate model can accurately capture all elements of the performance behavior.

SPE 167253 Decline Curve Analysis for Unconventional Reservoir Systems —Variable Pressure Drop Case - Petroleum Engineering | College of Engineering

Decline curve analysis techniques for the estimation of ultimate recovery (EUR) require the constant bottomhole pressure condition during the producing life of the well — whereas it is not regular practice to maintain a constant bottomhole pressure profile throughout production in unconventional reservoirs.

This course begins with a brief description of the theory of decline curve analysis and its background. Both type-curve fitting and type curve matching techniques will be explained and demonstrated. The more common type curve fitting methods are demonstrated using examples from fields in western Canada.

Decline curve analysis relates past performance of oil and gas wells to future performance, but it requires modification to account for changes in performance due to operating conditions or changes in reservoir behavior. Decline curves are simply a plot of production rate versus time on semi-log, log-log, or specially scaled paper.

The present work offers the method permitting to increase the informational content of the decline analysis, as well as to determine the value of initial reservoir pressure by combining «short» build-up welltest analysis with decline analysis in the operating well.

Decline-Analysis/Short Build-up Welltest Analysis of Low Permeability Gas Reservoir. - OnePetro

With respect to the decline curve analysis performed, a hybrid decline curve model was used to model different sections of the production profile. Since we are analyzing volatile oil reservoirs, the biggest challenge in performing traditional DCA is the effect of multi-phase flow behavior.

Decline curve analysis (DCA) is a graphical procedure used for analyzing declining production rates and forecasting future performance of oil and gas wells. Oil and gas production rates decline as a function of time; loss of reservoir pressure, or changing relative volumes of the produced fluids, are usually the cause.
