In statistics and statistical physics, the Metropolis–Hastings algorithm is a Markov chain Monte Carlo (MCMC) method for obtaining a sequence of random samples from a probability distribution from which direct sampling is difficult. This sequence can be used to approximate the distribution (e.g. to generate a histogram) or to compute an integral (e.g. an expected value).

representing that the data d is stating S regarding the relationship of some attribute(s) A to some object O in the world. Further assume $C(S)$ to represent the degree of confidence we assign to the given statement S . Then, data is regarded to be uncertain if $C(S) < 1$ while being precise, i.e., a singleton. Similarly, data is deemed as imprecise if the implied attribute A or degree of confidence ...
