### Solution Of Second Order Differential

Fact: The general solution of a second order equation contains two arbitrary constants / coefficients. To find a particular solution, therefore, requires two initial values. The initial conditions for a second order equation will appear in the form:  $y(t_0) = y_0$ , and  $y'(t_0) = y'_0$ .

Video transcript. So if  $g$  is a solution of the differential equation-- of this second order linear homogeneous differential equation-- and  $h$  is also a solution, then if you were to add them together, the sum of them is also a solution. So in general, if we show that  $g$  is a solution and  $h$  is a solution, you can add them.

Equation order. Differential equations are described by their order, determined by the term with the highest derivatives. An equation containing only first derivatives is a first-order differential equation, an equation containing the second derivative is a second-order differential equation, and so on.
